

### ABSTRACT OF THE DISCLOSURE

A mounting arrangement for a modular component such as a fuel tank on a vehicle includes sub-assembly of the fuel tank on a carrier for installation on the chassis. Alignment is provided by alignment arms extending outwardly from the chassis cooperating with mounting tabs disposed downwardly from the module. The alignment arms are members of a pair of brackets which are attached to the frame rails. The module rests on the brackets when lowered onto the chassis. Frame and module are connected by fasteners between the brackets and the mounting tabs.
